

CODE-SCAN HANDHELD SCANNER

NO MORE WRONG CODES

- Automate date and batch code selection
- Reduce the risk of operator error
- Speed up changeover between batches

The *code-scan* handheld scanner connects to your alphaJET or ICE printer to automate date and batch code message setup. It eliminates manual entry mistakes and speeds up batch changeover.

Operators no longer need access to the message editor. And there's no uncertainty over offsets or message format. Simply scan the barcode on your primary packaging or job pack to load the correct message or message content.

CODES IN YOUR CONTROL

The *code-scan* handheld scanner connects to your printer via RS232 or USB. Your QA team can programme all of your messages - or we can supply the scanner ready to go with messages on USB.

Once your messages have been set up and checked, all the operator needs to do is scan the barcode or 2D data matrix code on the primary pack or job pack to load the correct print message.

No manual entry.
No confusion.

Simple Operation

The scanner has been a relatively inexpensive way of removing human intervention for date code printing. It automates the date code format and shelf life allocation per product type or customer. It recognises individual packaging and automatically updates coding for the new year. It's easy to set up and use and as such, we would recommend to other companies.

Technical Manager, Cake Manufacturer

DETAILS

- Handheld scanner and stand
- Connects to printer with RS232 or USB
- Pre-programmed for selecting message or message content
- Can be supplied with files programmed on USB
- Optional setup and training available

KEY BENEFITS

- Removes manual entry requirement, helping towards compliance with customer codes of practice
- Reduces the risk of fines and other costs from incorrect date codes or lot codes
- Cuts setup time required for batch changeover
- Reduces operator training requirement for new or temporary staff
- Keeps your codes safe; operators don't need access to the label editor, guaranteeing the integrity of your message store
- Removes risk of confusion between similar packaging formats with critically different messages and offsets
